Group 7: Azamat Apazov (11693967), Bektur Mashaev (11693735), Zholuzak Khakimbek (11695692), Abdullah Shahid (11694038) and So Wing Hin (11555713)

Our project is an application that helps users in calculating their daily requirements for calories, protein, carbohydrates and fats. Our program performs these calculations automatically depending on an individual's weight, height, age, gender and activity level because doing them by hand can be hard and time consuming. It functions similarly to a basic user manager. You can add new users, search them, change their information or remove them. The program instantly recalculates the user's stats if their weight or aim (like gaining, losing or maintaining weight changes.

Our program includes basic checks to make sure bad inputs don't crash the app. All user information is saved right in the computer's memory while the program is running using standard lists and dictionaries. Overall, the project combines easy math formulas with a clean menu so users can manage health profiles straight from the terminal.
